GROUND WATER YEAR BOOK, BIHAR

(2023-2024)

ABSTRACT

Monitoring of ground water levels from 890 (800+90) Hydrograph Network Stations (HNS) were carried out in the year 2023-24 with an objective to assess ground water regime of phreatic aquifer. The water level monitoring was carried out manually in the months of May'23, August'23, November'23 and January'24. The ground water samples from the HNS were collected in the month of May'23 and November'23 for chemical analysis. The water level in the HNS represented phreatic aquifer.

The observed water level data had been grouped into four categories viz. 0-2 m, 2-5 m, 5- 10 m and >10 m. Thematic maps depicting ground water levels measured in different periods has been prepared. The water levels have been further analysed for study of its change with respect to measurement of pre-monsoon period of the same year, previous year water level data of the same period and decadal mean water level data of the same period. The fluctuation had been grouped under rise and fall categories. In each category there are three groups viz. 0-2m 2-4m and >4m. Thematic maps had been prepared for each category of fluctuation.

During the pre-monsoon of 2023, groundwater levels were found to vary between 0.85 and 15.9 m bgl in both confined and unconfined aquifers. The depth to water level rests in range of 2-5 m bgl is 56.28% of HNS, which spatially covered the major part of the area monitored. The depth to water level rests in range up to 2 m bgl spatially covered mainly southern part of North Bihar Plains (NBP) and at disseminated locations in (SBP). During post-monsoon 2023, water level rested in the ranges between 2-5m m bgl in 56.10% of the HNS which covers major part of the Bihar State. The fluctuation of water level between pre and post-monsoon 2023 indicated rise in water level in 75.90% of the HNS. Annual change of water level of May 2023 with respect to May 2022 indicated fall in water level in 78.02% of the HNS, and during November 2023 with respect to November 2022 indicated fall in 75.59% of the HNS. The change in water level of May 2023 with respect to the decadal mean of May (May 2013 to May 2022) indicated rise in 57.62% of the HNS and during November 2023 with respect to the decadal mean of November (November 2013 to November 2022) indicated rise in 82% of HNS.

GROUND WATER YEAR BOOK, BIHAR (2023-24)

1. INTRODUCTION

Bihar state lies between 83° 20' and 88° 00' E Longitudes and 24° 15' and 27° 23' N Latitudes. It shares international border with Nepal in the north and is bounded in the east, west and south by West Bengal, Uttar Pradesh and Jharkhand states respectively. The state covers geographical area of 94,163 Sq.km and has its capital at Patna (**Fig1**).

Administratively the state is divided into 38 districts and 534 community development blocks. The population of the State is 10.41 crores (2011 census). Population density is 881persons/Sq.km. The urban population is 11,758,016 and rural population is 92,341,436. There are 150 small and large towns in the state. The distribution of urban population is highly skewed as only three towns namely Gaya, Bhagalpur, and Muzaffarpur are having population of more than 3 lakhs, besides urban population of Patna urban agglomeration which is having 1,683,200.

2. HYDROGEOLOGY

Generalized stratigraphic succession of the state is presented in **Table 1**. The hydrogeological map of Bihar is depicted in **Fig2**.

Table 1: Generalized Geological Succession of Bihar.

<i>Age</i>	<i>Formation</i>	<i>Broad Lithology</i>
Quaternary	Alluvial Deposits	Sand, clay, silt and occasional gravel
Tertiary	Siwaliks	Sandstone, conglomerate, clay stone, gravel
L-Cambrian	Vindhyan Super Group	Sandstone, limestone.
Proterozoic	Chotanagpur Granite Gneiss	Granite, granitic-gneiss, schist, phyllites, dolomites, basic rocks, amphibolites.
Archean	Bihar Mica belt	Gneiss, Pegmatites etc.,

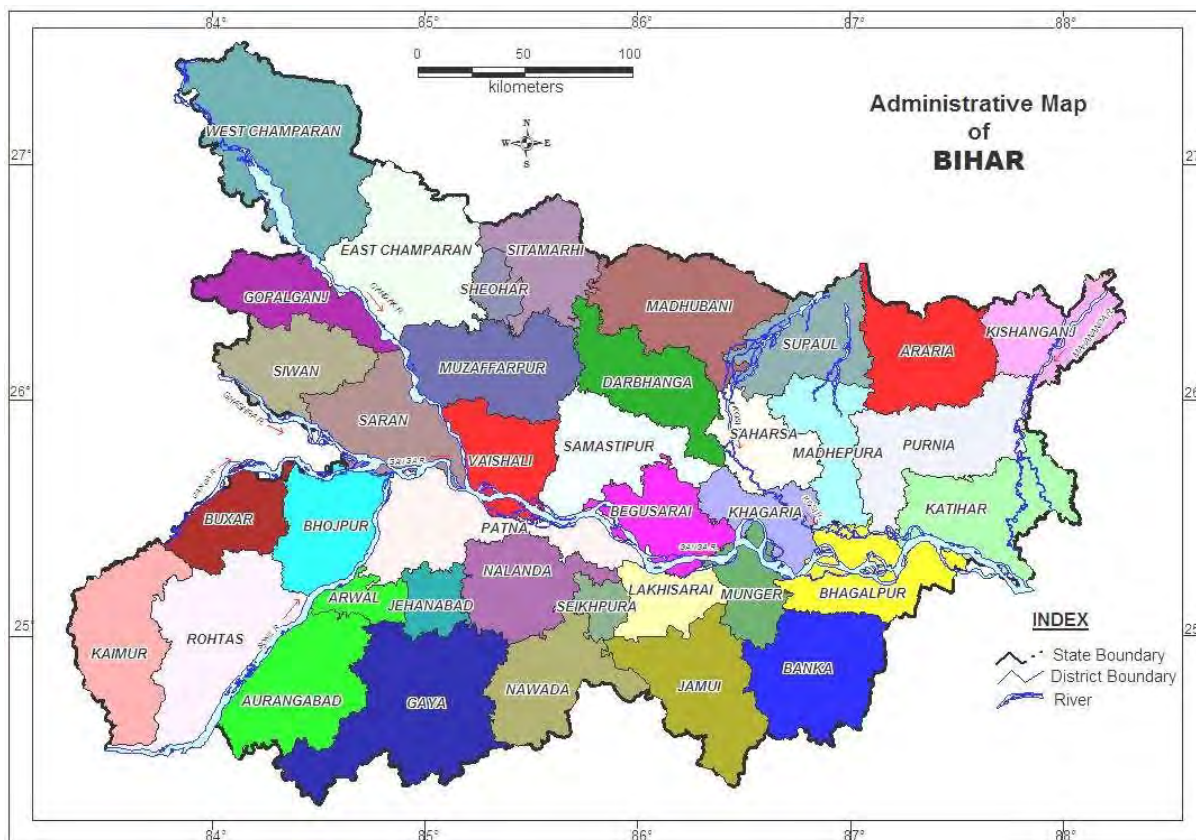

Figure 1: Administrative Map of Bihar state

Pre-cambrians

The rocks belonging to Proterozoic and Archean age are granite, granitic-gneiss, quartzite, phyllites, slates, and metabasites. Rocks of Chhotanagpur Granite Gneissic Complex (CGGC) suit occur in the form of small strip in the districts bordering Jharkhand state. Meta-basic rocks intrude the Chhotanagpur Granite Gneiss Complex suit of rocks. Mica bearing pegmatite of Bihar Mica Belt has been found in Gaya, Nawada and Munger districts. In parts of Munger, Gaya and Nawada districts the meta-sedimentary rocks (viz. phyllite, schist and quartzite) of Pre-cambrian age are also found.

The occurrence and movement of ground water is controlled by the thickness and nature of weathered mantle and saprolite zone (a transition zone between weathered residuum and fresh basement), besides fractures lying underneath the weathered residuum. Thickness of the weathered zone usually ranges from 5 to 20 m. Thickness of weathered zone are more in schist and other meta-sedimentary rocks in comparison to the granite-gneiss. The weathered product of granite and granite-gneiss is marked by presence of coarse granular materials composed of quartz and feldspar, whereas those of schist and phyllite by clayey materials.

Ground water occurs under unconfined condition within the weathered mantle and saprolite zone. In the secondary porosities imparted by joints, cracks and fractures, ground water occurs under confined to semi-confined conditions.

Vindhyan

Rocks of Vindhyan Super-group are confined in the west and north of the river Sone and forms eastern end of the Kaimur Plateau. It occurs in the parts of Rohtas, Kaimur and Aurangabad districts. The width of the Vindhyan rocks becomes less than 3 km near Sasaram in Rohtas district. Rocks found under this super-group are mainly sandstone, limestone, quartzite and schist. These rocks behave as consolidated formation and have remained unaffected by any large-scale tectonic disturbances, except faulting at a few places in the geological past. Vindhyan sandstones are compact and have low primary porosity. Ground water in this occurs within the weathered residuum and in the secondary porosity below them. Ground water occurs under unconfined condition in the weathered mantle. The thickness of the weathered residuum varies from 5 to 10m.

Siwaliks

The Siwaliks of Upper Tertiary age occur as small patches in northwestern corner of the state in West Champaran district bordering Nepal. It consists of sandstone, conglomerate, red clay and spongy limestone and forms structural hills with a number of faults crisscrossing them. Ground water occurs under confined conditions in sandstones disposed at depth.

Quaternary alluvium

Quaternary sediments of Recent to Sub-Recent age cover about 89 percent of the geographical area of the state. They occupy entire north Bihar plain, and a vast stretch of land between south of the river Ganga and the Chhotanagpur Plateau. Deep exploratory drilling by Central Ground Water Board has confirmed thickness of sedimentary deposits in north Bihar plain as more than three hundred meter. In the south of the river Ganga, the alluvial thickness gradually decreases to as low as 50 m or even less, towards the area bordering the Jharkhand state. The sedimentary deposit consists of alternate sequences of sand and clay layers representing multi-cyclic nature of sedimentation. The Quaternary alluvial deposit spread over south and north of the river Ganga is a part of Mid-Ganga Plain. The Terai belt, which is demarcated by auto-flow wells, occurs as a narrow strip in the bordering areas in Madhubani, Darbhanga, and West Champaran districts. It is an extension of Terai belt of Nepal which coalesces with alluvial plain. Ground water occurs under unconfined conditions in the phreatic aquifer, which is generally disposed within 70 m below ground. Aquifers situated at deeper levels have ground water levels under confined condition.

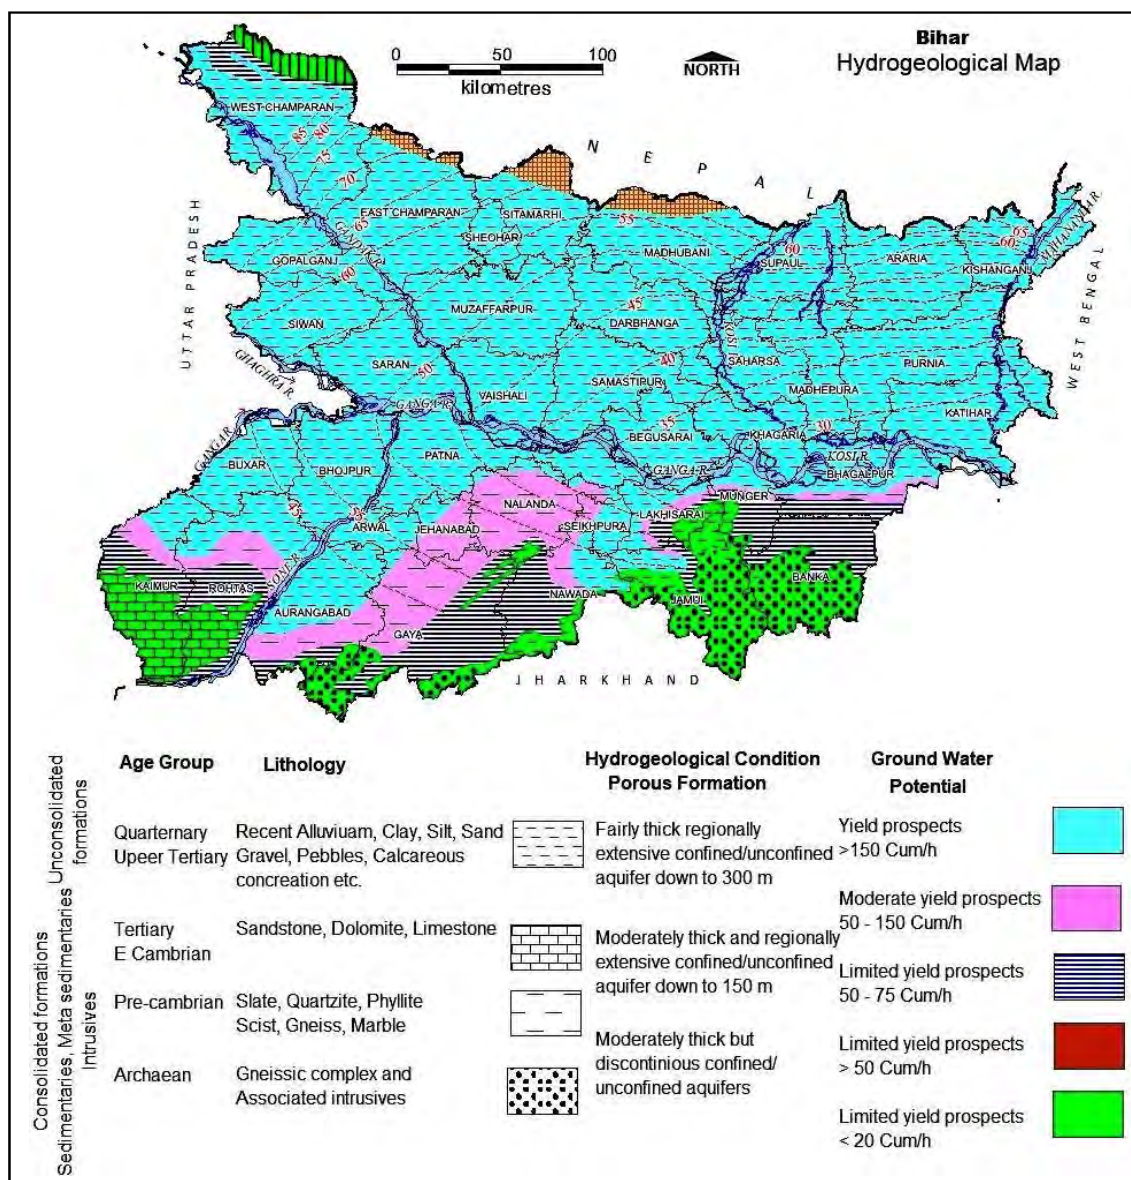

Figure 2: Hydrogeological Map of Bihar state

3. GROUND WATER SCENARIO

A total of 800 Hydrograph Network Stations (HNS) which are dug wells tapping phreatic aquifer have been monitored as a part of ground water regime monitoring in the state of Bihar. Majority of the wells represent phreatic alluvial aquifer. The district wise location and distribution of the HNS are given in **Fig 3** and **Table 2** respectively.

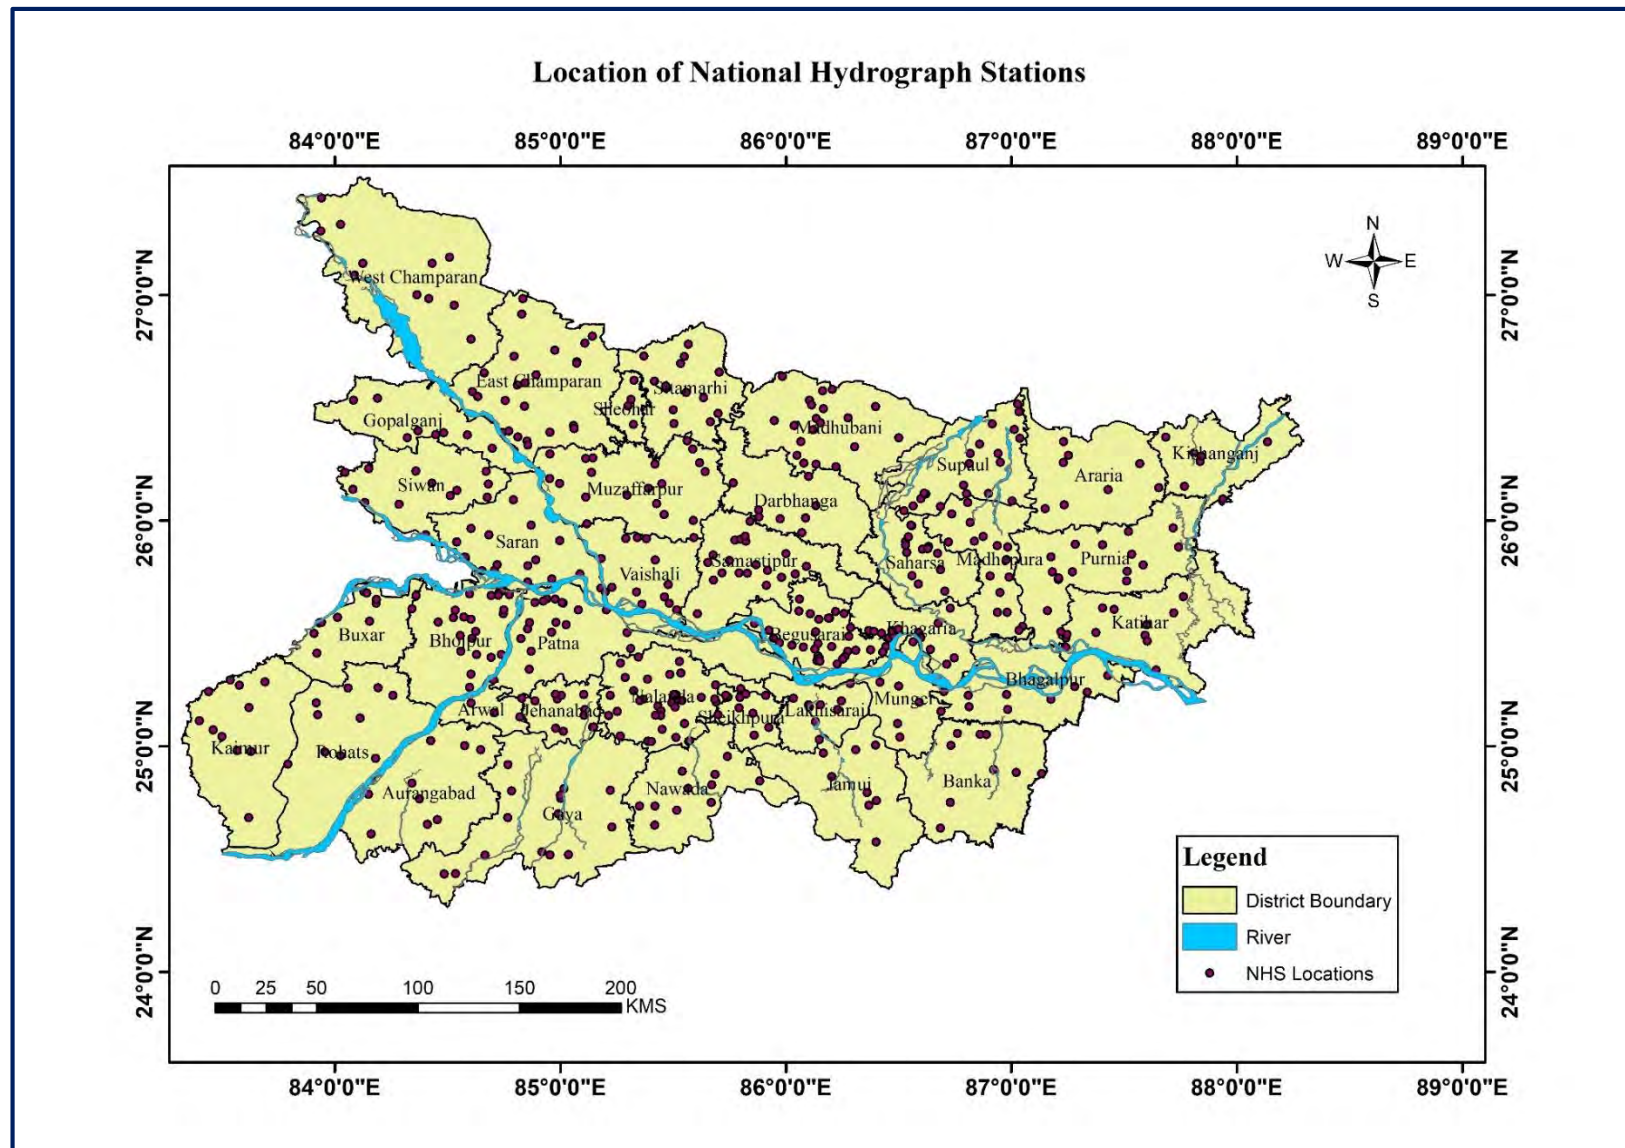

Fig 3: Locations of Hydrograph Network Stations of Bihar State 2023

The numbers of HNS monitored in the state as per the following monitoring schedules:

Table 3: HNS monitoring schedule

Sl. N.	Month	Date	Period
1	May	20 – 30	Pre-monsoon
2	August	1 – 10	Mid-monsoon
3	November	1 – 10	Post-monsoon
4	January	1 – 10	Recession

The Number of HNS monitored during the various monitoring period is given in **Table-4**. The water level data of HNS are presented in the Annexure Ia, Ib, Ic & Id. The observed data were analysed for each set of measurement and the thematic presentation of depth to water level and its fluctuations have been prepared manually in the range of 0 – 2 m, 2 – 5 m, 5 – 10 m and more than 10 m. Bihar state has been broadly divided into North Bihar Plain (NBP) consisting of areas falling to the north of the river Ganga and South Bihar Plain (SBP) consisting of areas falling to the south of the river Ganga and bordering Jharkhand state.

Table 4: Number of HNS monitored/analysed during different months

State	May 2023	August 2023	November 2023	January 2024
Bihar	652	716	790	720

DEPTH TO WATER LEVEL

May 2023

During Pre- Monsoon period (May 2023), 652 HNS dug wells were analysed. The water level data observed has been ranged from 0.85 (lakhisarai) to 15.9 m bgl (Bhagalpur) m bgl. The results indicate that 2.3 % of the wells exhibit water levels below 2 mbgl, 43.56% fall within the range of 2 to 5 mbgl, 52% have levels between 5 and 10 mbgl, and 1.5% show water levels exceeding 10 mbgl.

Shallow water levels of less than 2 to 5 meters below ground level (mbgl) are mainly observed in the upper part of northern Bihar and in small patches scattered throughout the State. .

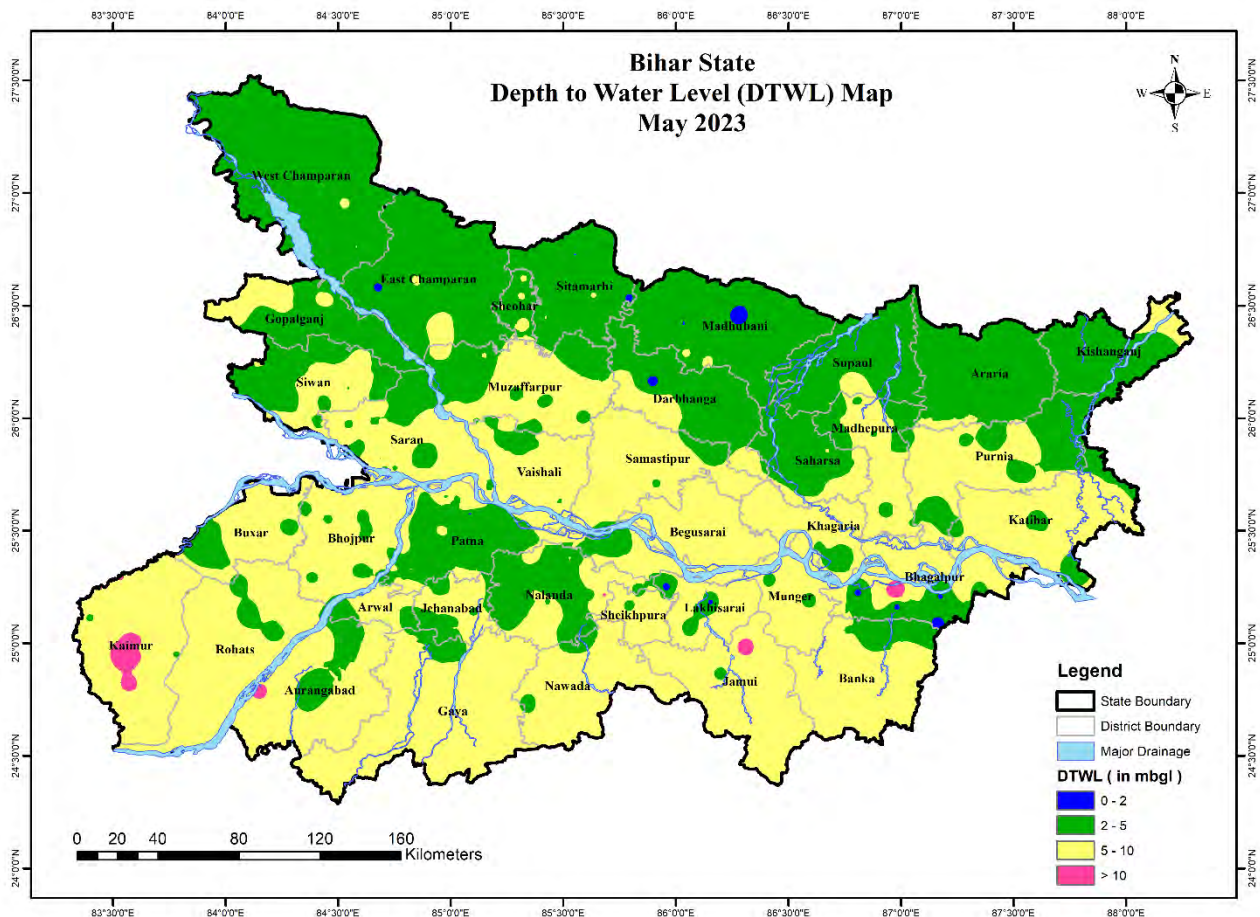

Figure 4: Depth to water level in May 2023

The major part of the area covered under monitoring has shown water levels at a depth of 5 to 10 m, while water levels deeper than 10 mbgl are found in very few small patches in the southwest corner of Bihar.

August 2023

Total 716 NHS dugwells has been analysed where depth to water level ranged from 0.05 (Darbhanga) to 12 m bgl (Nalanda). The findings reveal that 29% of the wells have a water level of less than 2 mbgl, 56% of the wells have water levels between 2 and 5 mbgl, 14% have water levels between 5 and 10 mbgl, and 0.5 % have water levels deeper than 10 mbgl.

Shallow water levels of less than 2 mbgl are primarily found in the upper part of northern Bihar and in scattered patches throughout the state. Water levels between 2 and 5 mbgl are observed across Bihar, while levels between 5 and 10 mbgl are present in some patches in the southwest. Water levels deeper than 10 mbgl are seen in a few small areas in the southwest corner of Bihar.

(Fig. 6; Table 6)

November 2023

Total 790 HNS dug wells were analysed during post-monsoon period (November 2023). The minimum and the maximum depth to water levels have been recorded to be 0.25 m bgl (darbhanga district) and 15.8 m bgl (Jamui district) respectively. The findings indicate that 15% of the wells have water levels of less than 2 mbgl, 64% have levels between 2 and 5 mbgl, 21% fall within the 5 to 10 mbgl range, and 0.7% have water levels deeper than 10 mbgl.

Shallow water levels of less than 2 mbgl are primarily found in the few patches upper part of northern Bihar. Water levels between 2 and 5 mbgl are observed across Bihar, while levels between 5 and 10 mbgl are present in some patches in the south of State. Water levels deeper than 10 mbgl are seen in a few small areas in the south of Bihar.

January 2024

During the recession period (Jan. 2024), total 720 HNS dug wells were analysed. The minimum depth to water level of 0.22 m bgl has been observed in Madhubani district, and maximum water level of 12.92 m bgl in the Bhagalpur district. The findings reveal that 6% of the wells have a water level of less than 2 mbgl, 63% of the wells have water levels between 2 and 5 mbgl, 30% have water levels between 5 and 10 mbgl, and 0.83 % have water levels deeper than 10 mbgl.

During Jan. 2024. Shallow water levels of less than 2 to 5 mbgl are observed in the throught of Bihar. Water levels between 5 to 10 mbgl are observed in small patches, while levels between more than 10 are present in very few patches in the south of State

SEASONAL FLUCTUATION

May 2023 to August 2023

A total of 556 wells have been analysed to study the monsoon fluctuation during August 2023. Rise in water level has been recorded in 526 (approx. 95 %), whereas the fall is observed only in 30 (approx. 5 %) of HNS analysed. The area covered by the analysed wells has been depicted on **fig. 9**. Fluctuations in water levels have been categorized into different ranges. Among the observed HNS, 41% exhibited a rise in water levels between 2 and 4 meters, 36% showed an increase of 0 to 2 meters, and 15% demonstrated a rise of more than 4 meters. These ranges of water level rise have been observed in almost entire area covered in monitoring.

Total 30 wells located in southern Bihar have shown fall in water level. (**Table 9**).

May 2023 to November 2023

Water level of 603 HNS were analysed as to compare with the water level during May 2023. As per the comparison between Nov. 2023 and May 2023, rise of water level observed in 569 (94%) whereas, 34 (5 %) HNS have shown fall in water. The majority of HNS (322 well, 53%) have shown rise in the range of 02 m, whereas the 209 (34%) and 38 (6%) NHS have shown rise in water level rise 2 to 4 and > 4 mm respectively.

The water level fluctuation has been depicted in **Fig. 10** & Table No. 10.

May 2023 to January 2024

Water level of 584 HNS were analysed as to compare with the water level during May 2023. As per the comparison between January 2024 and May 2023, rise of water level observed in 490 (83%) whereas, 94 (16 %) HNS have shown fall in water. The water level fluctuation has been depicted in **Fig. 10** & Table No. 11.

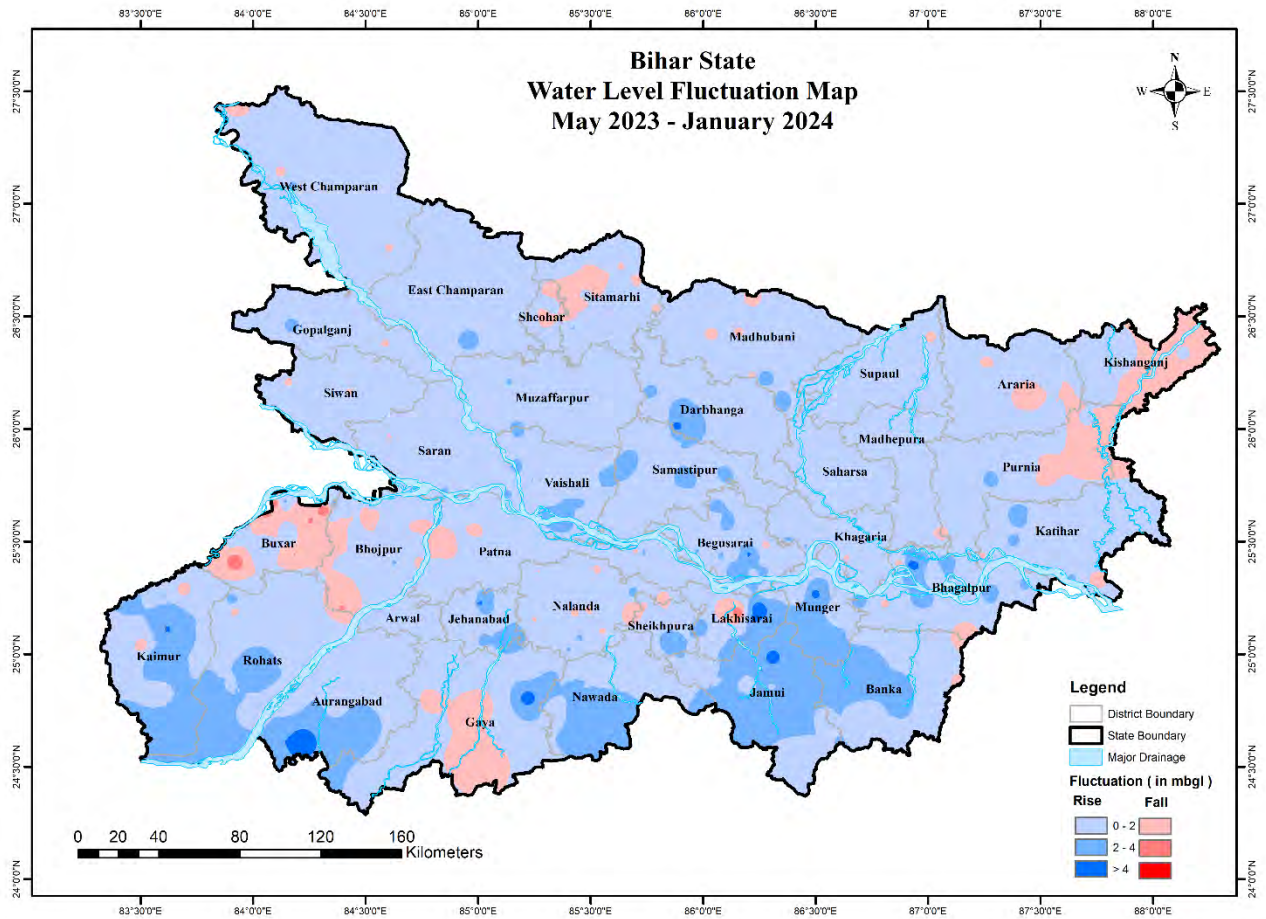

Figure 10: Fluctuation in ground water level between May 2023 and January 2024

ANNUAL FLUCTUATION

May 2022 to May 2023

Water level fluctuation between May 2022 and May 2023 has been done for 466 HNS locations. The covered area for annual fluctuation has been shown in Fig. 11. Fall in water level has been observed in 80 % of the well analysed which covered the major portion of the monitored area. Out of which fall of 0 – 2m has been recorded in 62 % (295), fall between 2-4m has been recorded in 11 % (16) of the HNS monitored. About 3% of the well monitored has shown fall in water level more than 4m.

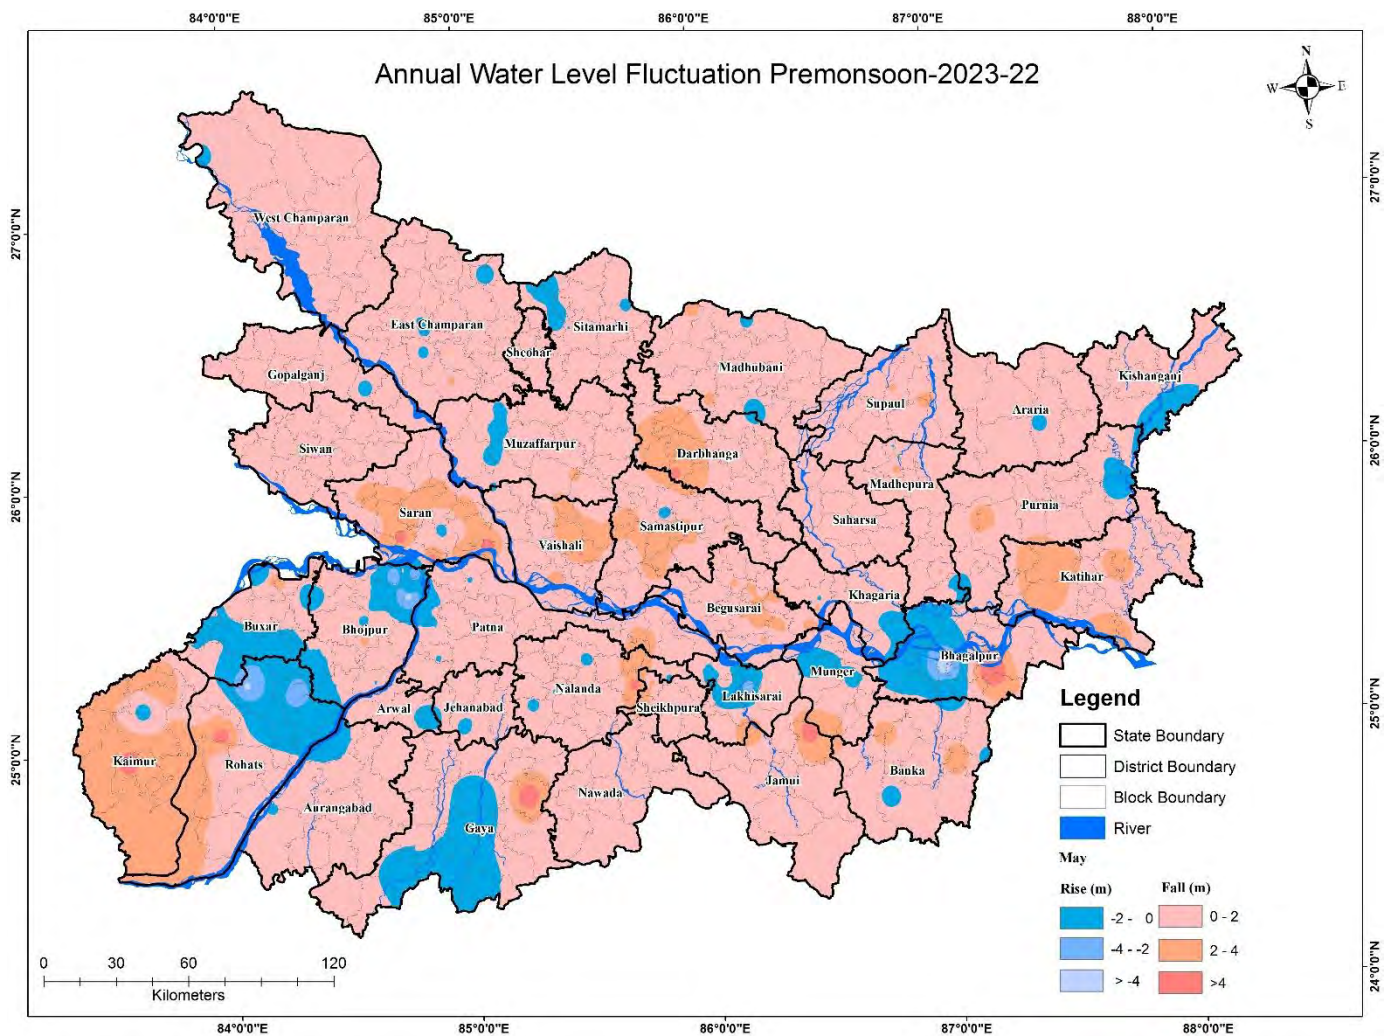

Figure 11: Fluctuation in ground water level between May 2022 and May 2023.

Table 12: Districtwise categorization of frequency and fluctuation water levels of HNS of May. 2023 w.r.t. May. 2022 for Bihar State

August 2022 to August 2023

Water level fluctuation between August 2022 and August 2023 has been done for 543 HNS locations. The covered area for annual fluctuation has been shown in **Fig. 12**. The comparison indicates the rise of water level in 58.01% (315 wells) of the HNS analysed which covered extreme north west and eastern part of Bihar.

November 2022 to November 2023

Water level fluctuation between November 2022 and November 2023 has been analysed for 616 HNS after carrying out monitoring in entire State. The analysis indicates that there is fall of water level in about 57.9% of the HNS. Out of which fall of 0 – 2m has been recorded in 48.3% (314, fall between 24m has been recorded in 5.1% (35) of the HNS monitored. About 1.3% of the well monitored has shown fall in water level more than 4m. (Fig.13, Table 14).

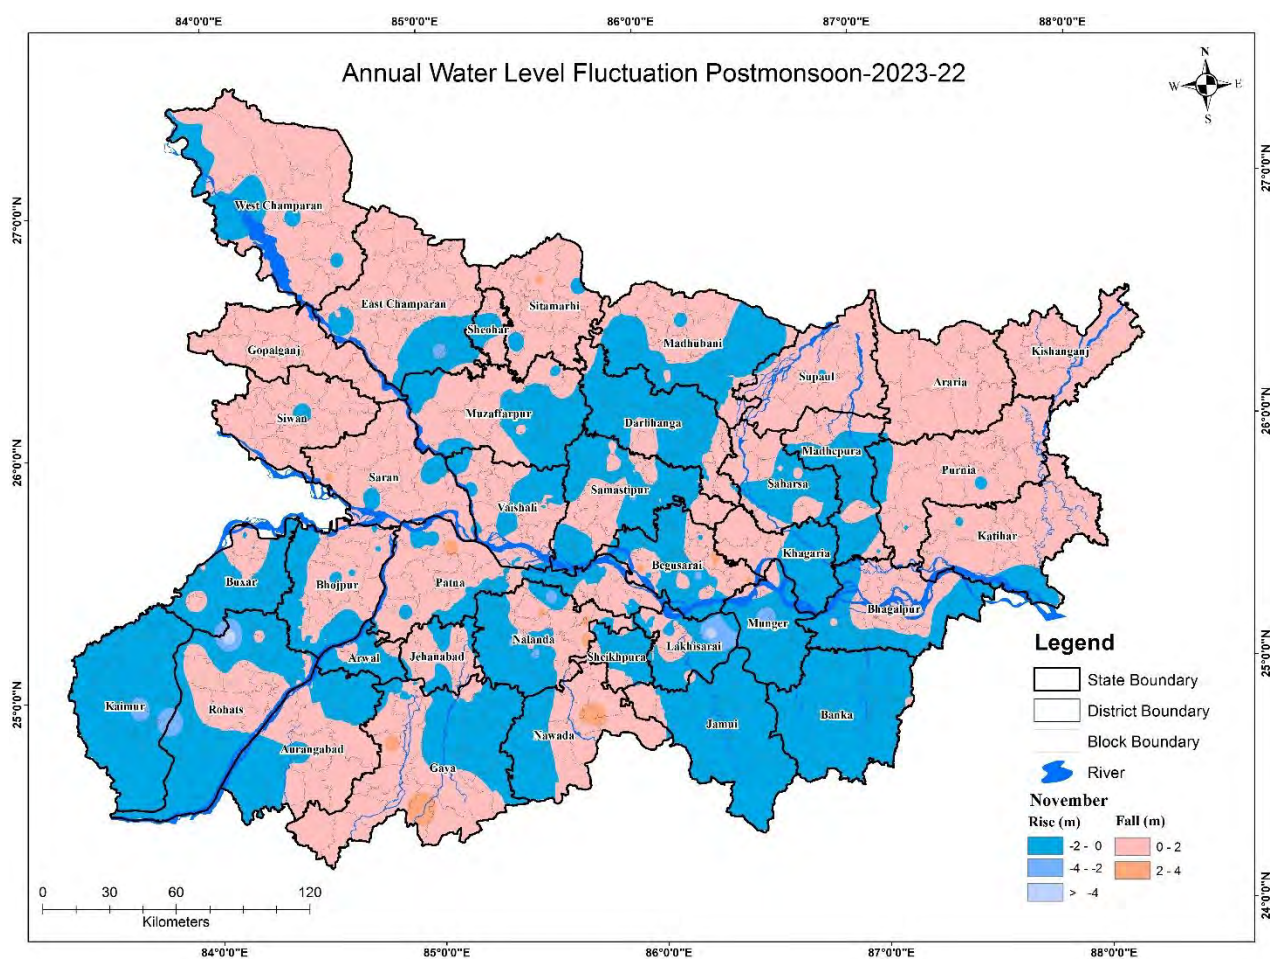

Figure 13: Fluctuation in ground water level between Nov 2022 and Nov. 2023

January 2022 to January 2023

Water level fluctuation between January 2023 and January 2024 has been done for 659 HNS locations. The covered area for annual fluctuation has been shown in **Fig. 14**. The comparison indicates the fall of water level in 62% (410 wells) of the HNS analysed which covered major part of the area.

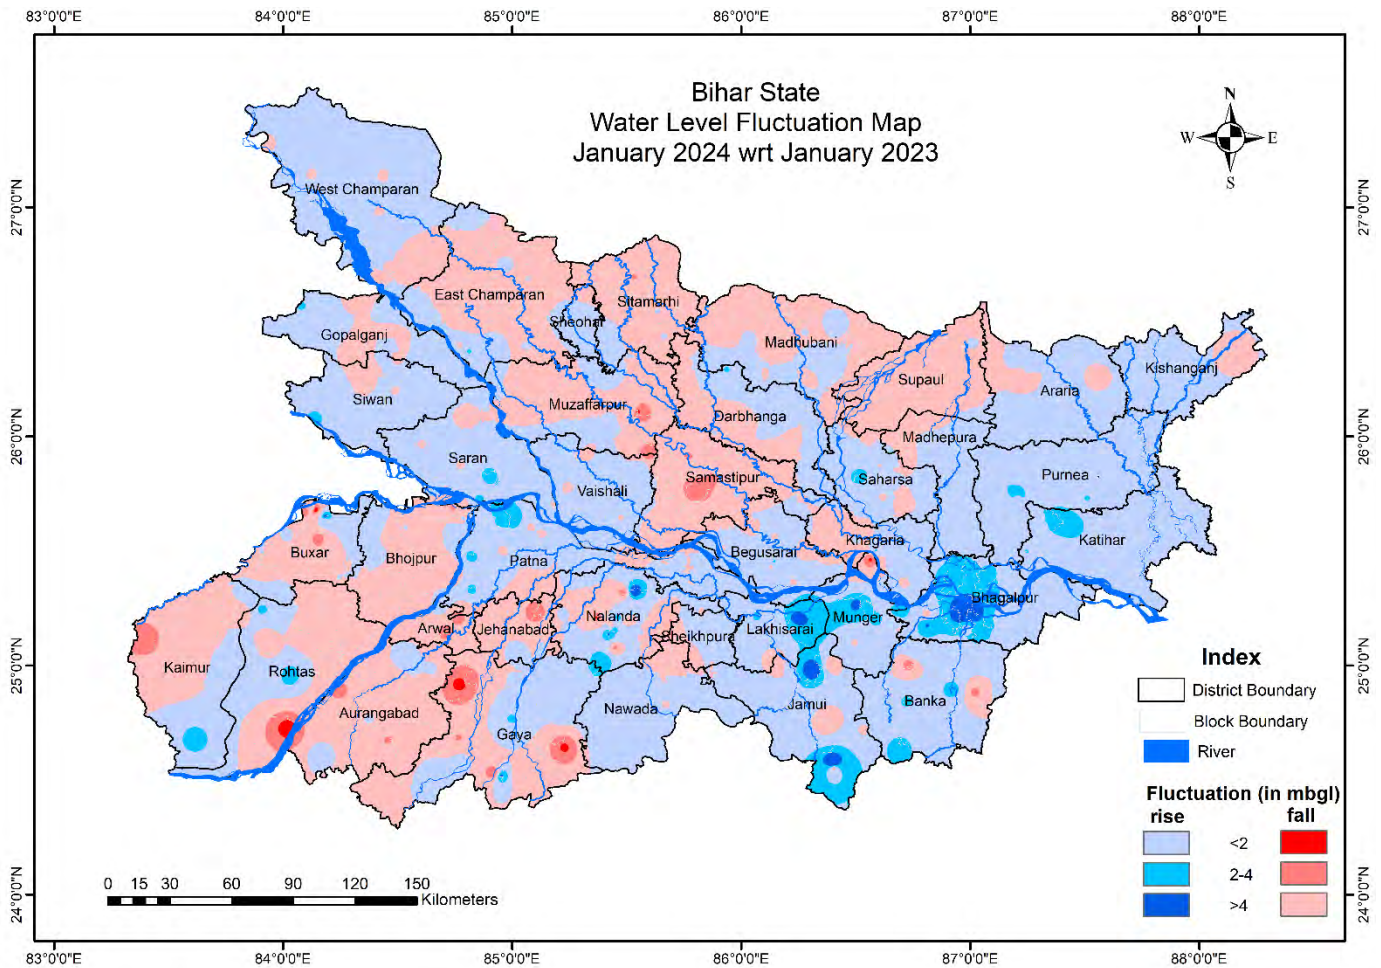

Figure 14: Fluctuation in ground water level between Jan 2024 and Jan. 2023

Table 15: Districtwise categorization of frequency and fluctuation water levels of HNS of Jan. 2024 w.r.t. Jan. 2023 for Bihar State

3.4 DECADAL FLUCTUATION

Decadal Mean of May (Mean 2013-22) w.r.t May 2023

Fluctuation in water level of May 2023 with respect to decadal mean of May has been analysed for 589 HNS, which indicates rise in 57.6 % and fall in remaining 42.37% HNS. The rise of water level in the range of 0 – 2 m is observed in 52% of the HNS monitored.

Fall is observed in 219 wells and mostly ranges upto 2 m (178 wells). (Table-16)

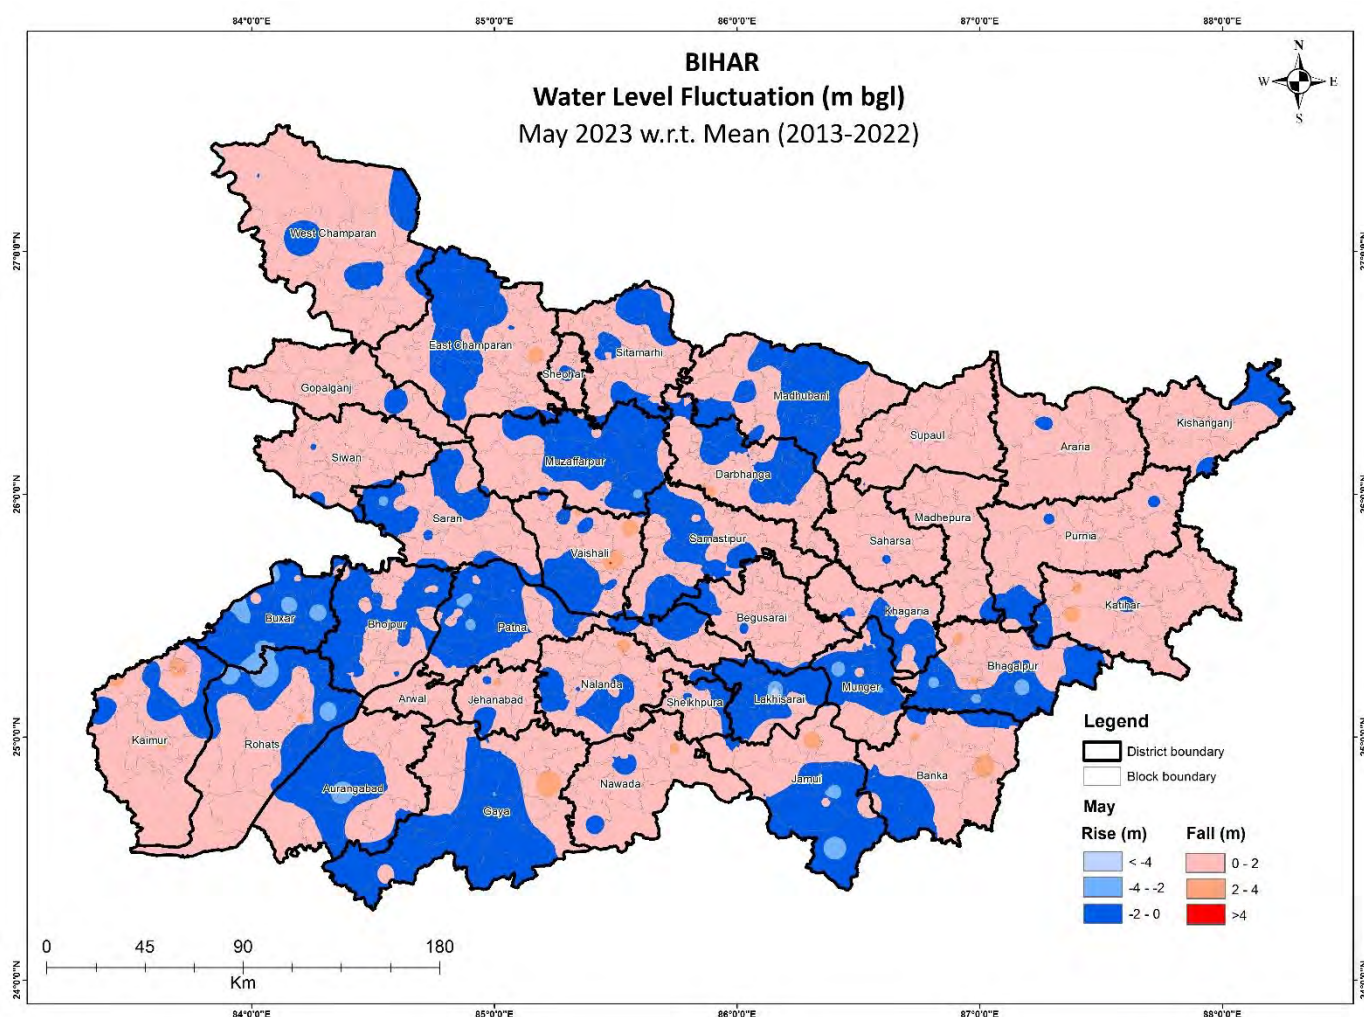

Figure 15: Fluctuation in water level between May (mean) and May2022

Decadal Mean of August to August 2023

The fluctuation in the water level for August 2023, compared to the decadal mean for August, has been analyzed for 551 HNS. The analysis indicates a fall in water levels in 53% of the HNS. Of these, 43% (242 HNS) show a decline of up to 2 meters, 7% show a rise in water level within the range of 24 meters, and 8 HNS have shown a water level fall of greater than 4 meters (**Table-17**)

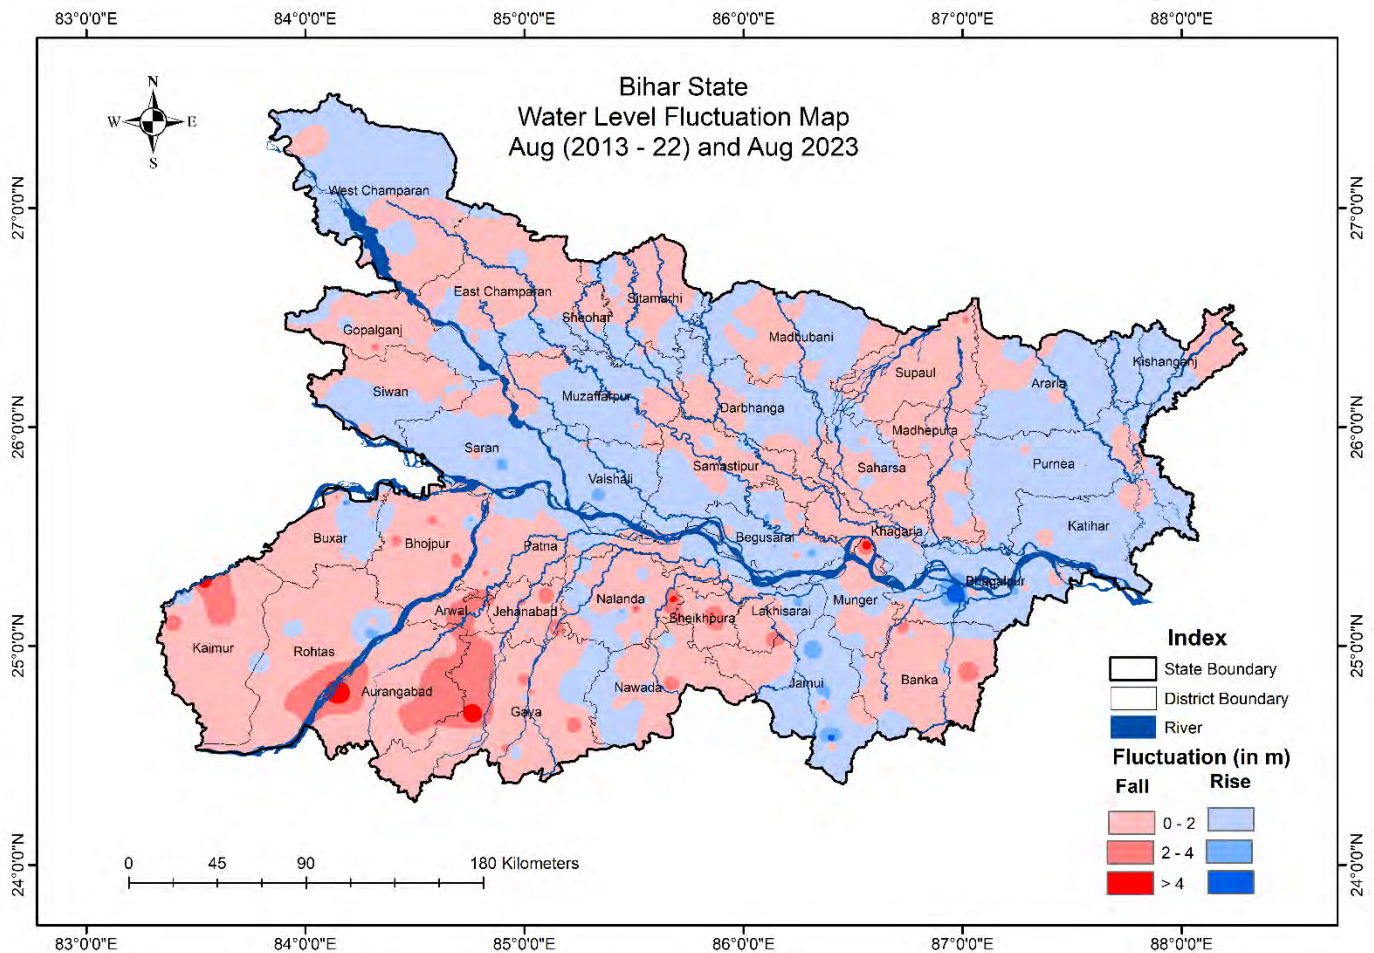

Figure 16: Fluctuation in water level between August (mean) and August 2023

Decadal Mean of November to November 2023

Fluctuation in water level during November 2023 with respect to decadal mean of November has been analysed for 605 HNS,. Major part (51%) of the State has shown water level fall in the range of 0 to 2m. The fall between 2 and 4 m has been observed in 5.6% of NHS analysed and 13 HNS have shown water level fall of > 4m.. (Fig. 17, Table 18.)

Decadal Mean of January (2014-23) w.r.t January 2024

The fluctuation in the water level for January 2024, with respect to the decadal mean of January, has been analyzed for 513 HNS. In 356 (69%) of the HNS, a fall in the water level has been recorded. Among these, a fall of 0–2 meters was recorded in 62% (323 HNS), a fall between 2–4 meters was recorded in 5% (30 HNS), and about 0.5% of the wells monitored showed a fall in the water level of more than 4 meters. (Fig. 18, Table 19).

Piezometric Head

Total 73 wells have been taken for the preparation of premonsoon map for piezometric head. Their mutual distance is not sufficient enough for interpolation by natural neighbouring method. The maps for piezometric head have been prepared for the premonsoon 2023. In general, the piezometric head has been observed to be deeper than the depth to water level of the area.

May 2023

The area covered under mapping is shown in figure 19. The piezometric head ranged from 17.82 (Gaya District) to 2.7 (Kaimur (Bhabua)) m bgl. The figure indicates that southern part of the area is deeper in the category of more than 10 m bgl. The piezometric head in other part of the area is between 5 to 10 m bgl.

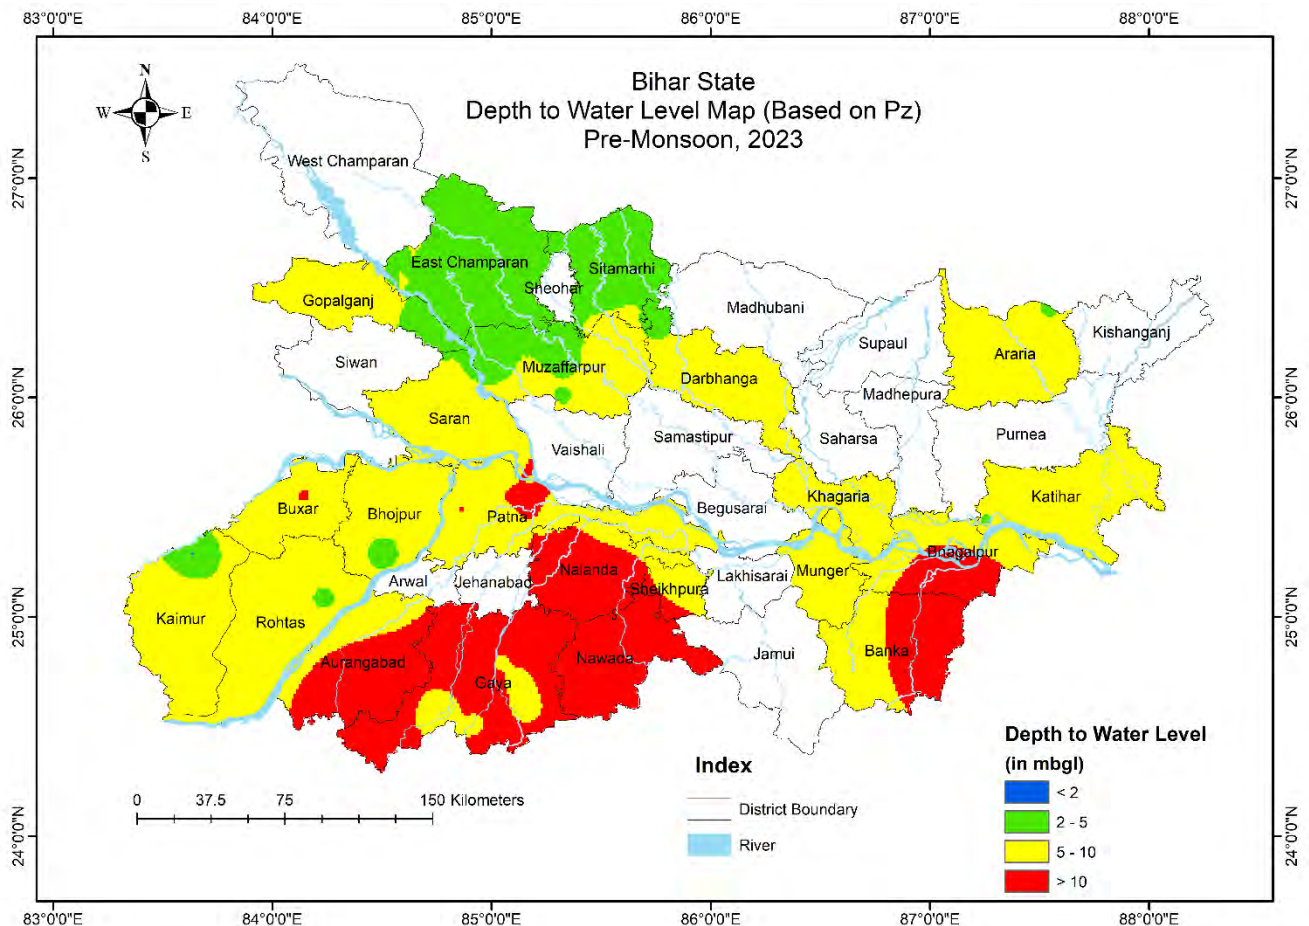

Figure 25: Piezometric head in May 2023

November 2023

Piezometric head during November 2023 has been observed between 1.8 mbgl (Muzaffarpur) to 18.95 mbgl (Nalanda dist.) . The figure indicates that southern part of the area is deeper in the category of more than 10 m bgl.
